RESULT AAA08401 Carcinoembryonic antigen; CEA; sheep; monoclonal antibody; tumour associated antigen; anti-carcinogenic; cytostatic; cancer therapy; ds. 09-MAR-2000 Ovis sp. Carcinoembryonic antigen affinity antibody light chain variable region. 13-JUL-2000 AAA08401; AAA08401 standard; DNA; 333 BP WO200012556-A1 (KSBI-) KS BIOMEDIX LTD. 28-AUG-1998; 20-AUG-1999; P. (first entry) 98GB-0018915 99WO-GB02729

A new high-affinity monoclonal antibody that is characterized by an

P-PSDB; AAY82529 WPI; 2000-375618/32. Harrison

The antibody is used in cancer therapy. Association of the new antibody with an antigen is favoured over dissociation in vivo and they therefore have longer localisation times at target sites, resulting in a higher concentration of antibodies localised at the target sites. Targeting the antibody to a site in vivo is improved. The concentration of antibody does not need to be too high which reduces side-effects and costs of therapy. The present sequence encodes the light chain variable region of a monoclonal antibody having affinity for carcinoembryonic antigen (CEA, a tumour associated antigen), which is used in the exemplification

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel fusion protein (I) that has, at its CN-terminus, one or more epitopes that bind specifically to autoantibodies (AAb) against the islet cell antigen IA2 and, at its C-terminus, one or comore epitopes that bind specifically to antibodies (Ab) directed against the glutamate decarboxylase GAD65. (I), also nucleic acid (II) encoding (II) vectors containing (II) and transformed cells, are useful for CC diagnosis and prognosis of diabetes mellitus type I, stiff man syndrome, copylandular autoimmune syndrome or other autoimmune conditions associated with Aab against GAD65 or IA2. (I) provides a rapid and simple CC diagnosis of high specificity and sensitivity, capable of recognizing antibodies against both IA2 and GAD65, simultaneously. Unlike known CC fusions, where the GAD65 component is at the N-terminus, (I) contains CC correctly folded conformational epitopes that can react with most MICA-10 autoantibodies. This sequence encodes the human autoantibody MICA-10 crariable region heavy chain used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

These can be used in the diagnosis and treatment of various autoimmune disorders, infections and cell proliferation diseases. The diseases include AIDS, adult respiratory distress syndrome, anaemia, asthma, atheroscierosis, Crohn's disease, irritable bowel syndrome, multiple sclerosis, myasthenia gravis, osteoarthritis, rheumatoid arthritis, scleroderma, systemic lupus

Okuno Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to producing gene libraries, comprising immunoglobulin light and heavy variable region. The method involves selecting light chain that binds with the heavy chain product to produce a functional conformation, producing a gene library comprising a collection of these light chain variable genes, and combining with gene library of heavy chain variable genes. The method is used for production of the production of the production of the production variable genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    formation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Producing gene libraries and antibody libraries, involves selecting a light chain that binds to a heavy chain product to produce a functional formation, and producing a gene library of the light chain variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gene library;

                                                                                                                                                                                                                                                                                                          The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as lazheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Inmune system suppression, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for recentral civity and inflamation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; nootropic; immunosuppressant; cytostatic; gene therapy; cance peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Вþ
This sequence represents cDNA encoding an internalising humanised antibody, scFv F5, which specifically binds to the extracellular domain of the c-erbB-2 receptor, the protein product of the HBR/neu oncogene. The scFv F5 antibody binds to the epitope of the c-erbB-2 receptor that is bound by F5 antibodies. On binding the c-erbB-2 receptor, the antibody is transported into the cell. The c-erbB-2 receptor is a marker protein which is overexpressed by 30-50% of breast carcinomas and other adenocarcinomas, and thus provides a useful cell surface marker for specifically targetting tumour cells.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc may include cytotoxins such as ricin, abrin or Pseudomonas exotoxin;
cc radionuclides; ligands such as growth factors; therapeutic agents such
cc as vinblastine, vindesine or melphalan; ribozymes; or antisense
cc molecules. The antibodies may also be used for in vivo or in vitro
cc detection and/or quantitation of the c-erb-2 receptor and thus diagnosis
cc and/or localisation of cancers characterised by expression of c-erb-2.
cc Although antibodies have previously been used to target tumour cells,
cc their success has been limited. The utility of prior art antibodies has
cc been hampered by the paucity of tumour specific antibodies, antibody
cc immunogenicity, low binding affinity, and poor tumour penetration.
cc tumour specific human antibodies were available. However, the production
cc fumunogenicity could be avoided and toxicity reduced if high affinity
cc tumour specific human antibodies were available. However, the production
cc fumunogenicity antibodies using conventional hybridoma technology
cc has proven difficult. Also, most of the antibodies produced react with
cantigens that are also common to non-malignant cells, which makes them

The specification describes a substance can inhibit the binding between hepatitis C virus (HCV) and cells with potential HCV infection, cells with expression of CD81, or CD81. This substance is especially an antibody with affinity towards HCV E2/NS1 protein, containing amino acid sequences based on the complementarity determining region (CDR) 1, CDR2 and CDR3 of the H and L chain variable regions. The antibody inhibits the viral envelope glycoprotein. It is also a CD81 inhibitor. The antibodies and drugs are used for treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Remedies for hepatitis C containing substances with antiviral effects e.g. antibodies, proteins, sulfated polysaccharides and low-molecular compounds, by inhibiting binding of hepatitis C virus envelope glycoprotein or CD81 -

The specification describes a substance can inhibit the binding between hepatitis C virus (HCV) and cells with potential HCV infection, cells with expression of CD81, or CD81. This substance is especially an antibody with affinity towards HCV E2/NS1 protein, containing amino acid sequences based on the complementarity determining region (CDR) 1, CDR2 and CDR3 of the H and L chain variable regions. The antibody inhibits the viral envelope glycoprotein. It is also a CD81 inhibitor. The antibodies and drugs are used for treatment and/or prevention of because the contained and contained the complementarity determining regions.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes the H chain variable region of a single chain antibody of the invention. The specification describes a substance can inhibit the binding between hepatitis C virus (HCV) and cells with potential HCV infection, cells with expression of CD81, or CD81. This substance is especially an antibody with affinity towards HCV E2/NS1 protein, containing amino acid sequences based on the complementarity determining region (CDR) 1, CDR2 and CDR3 of the H and L chain variable regions. The antibody inhibits the viral envelope glycoprotein. It is also a CD81 inhibitor. The antibodies and drugs are used for treatment and/or prevention of hepatitis C, or for diagnosis of hepatitis C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Remedies for hepatitis C containing e.g. antibodies, proteins, sulfated compounds, by inhibiting binding of

                                                                                                                                                    AASO3401-AASO3535 represent anti-adipocyte monoclonal antibody heavy and light chain coding sequences of the invention. The antibodies can be used in the treatment of obesity and obesity related diseases. The contibodies can be used to deliver drugs or pro-drugs directly to the fat mass of an obese patient or the antibody can be used as a therapeutic tiself. Antibodies binding specifically to adapocytes can be used to activate the immune system to destroy the calls by complement mediated lysis. The antibodies may be labeled with a detectable label such as cradiolabel, fluorescent or chemical group and used in methods of diagnosis in human subjects e.g. to determine the presence of adapocyte antipen on the surface of an adipocyte to detect or determine the presence or level of adipocytes in a cell or tissue sample. The cantibodies can be used as an alternative means of treatment for obese patients other than undergoling surgery to remove excess fat. Antibodies con different types of fat deposits can also be produced e.g. intra-

The invention is useful for stimulating bovine mammary gland cell growth and function, inhibiting the growth of various mammary gland cancer cells, inhibiting angiogenesis and vascularization of tumours, or modulating the growth of blood vessels in a mammal.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              binding member comprising the D5 VH and/or VI variable domain when bound to human serum amyloid protein, to pass through a mammalian blood brain barrier (BBB). The panel is useful for the selection of specific binding members with a desired property such as ability to cross BBB, ability to bind endothelial cells or other brain cell antigen, ability to bind areas of inflammation in the brain or BBB breakdown or ability to bind thracellular adhesion molecules and to bind transferrin receptor. The antibodies are useful in diagnosis, prophylaxis and treatment of human or animal body, including neurological diseases, such as Alzheimer's disease, prion disease, AIDS-related dementia, epilepsy and traumatic brain injury and any diseases involving inflammation occurring within the brain or central nervous system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes an antibody variable light chain (VL) fragment. The fragment is used to produce a mixture or panel of 5 different specific binding members, but comprising an antibody VH and/or VL variable domain and capable, when displayed on the surface of filamentous bacteriophage particles or in the case of a specific binding member comprising the D5 VH and/or VL variable domain when
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mixture or panel of antibodies for selecting specific binding members that cross the blood brain barrier, for use in delivering different molecules and treating neurological diseases
